CS135 Project 1

For your project, you will create a text-based adventure game. This project must be completed in C++. The game will run in the console and will involve navigating through different rooms, encountering challenges, and managing items. This project covers a variety of topics we've discussed in class, such as functions, loops, conditionals, and user input.

Project Details:

Objective: Create a text-based adventure game where the player can move between rooms, interact with objects, and face simple challenges. The game should provide an engaging experience through console output and user interaction.

Requirements:

1. **Custom Data Structures (Optional):** Implement a Room class to represent different rooms in the game. The Room class should include methods for movement, locking and unlocking rooms, and handling room descriptions. Although this is optional, using a class could help you organize your code better.

2. **Room Navigation:** Allow the player to move between rooms using user commands (e.g., "go north"). Some rooms may be locked and require special conditions to unlock.

3. **Challenges and Items:** Include at least one challenge or puzzle and items that can be collected and used. For example, a room might contain a key that unlocks another room.

4. **Special McGuffin:** Introduce a special item, or "McGuffin," that is essential for winning the game. For example, the player might need to find and use a magical artifact or a hidden object to unlock the final room or achieve the game's objective.

5. **Functions Requirement:** Your game must include at least a couple of functions (e.g., for moving between rooms, interacting with items, or handling challenges) to meet the project requirements.

Submission Requirements (3 items):

- Submit your source code file as project1.cpp
- Provide a printout or screenshot of a successful sample output from your game, demonstrating different functionalities. Call this file project_output.txt
- Finally, you must provide a 1-page write-up describing your game and the design approach you used. Call this file project_design.txt
- Submit your files via the Canvas submission for Project 1.

If you encounter issues with Canvas, you may email both files to dennis@tmcc.edu by the due date. Use the following subject lines based on your class time:

- **For the 3:00 class:** CS 135 PROJECT 1 YOUR LAST NAME
- **ONLINE:** CS 135-3001 PROJECT 1 YOUR LAST NAME

Note: This project is intended to help you apply the concepts we've learned in class. Make sure to test your game thoroughly to ensure all features work as expected.
